Fedora is **great** for developers

Fedora is **awful** for developers

Types of development

- **Web front-end/back-end development (and mobile back-end)**
- Scientific computing / Big data
- Native application development
- Low level system development (kernel + friends)
- Mobile app development
- Game development

Modern Development

Modern Development

- Your workstation package set is not your SDK

Modern Development

- Your workstation package set is not your SDK

- Reproducible development environment
  - not a pet / unique flower

Modern Development

- Your workstation package set is not your SDK

- Reproducible development environment
  - not a pet / unique flower

- Standard development environment
  - Contributors can use the same development environment without regard to their Workstation OS/version
  - Even same environment for test and deploy

Why make decisions

How do we make decisions?

What if someone doesn't like our decision?

Clear road blocks

Creating a slick experience

Just enough smarts
Just enough conventions

"Projects" not raw terminals

Simple scratch containers

Planning End-to-end

Easy way to create a project

Keep close to upstream

Introduce best practices step-by-step

We're not done until the user's app is deployed
